beyond surfaces. beyond carpentry.

Organoid®

Differently finely ground, biogenic materials such as spruce chips, alpine grass, old wood, waste paper, nettle, flax fiber, cornflowers, larch needles, or wood fibers are just a few of a variety of renewable resources that form the basis for the simple and revolutionary organoide® process. Decorative coatings can be produced from almost any natural fibers. By adding a natural binder, the end product is 100% biodegradable. Depending on the composition, the compacted material can be refined with a variety of different surfaces. The numerous environmentally friendly and sustainable benefits open up new horizons for design and architecture.
